

ABSTRACT OF THE DISCLOSURE

An electromagnetic shielding plate having high shielding effect is provided.

5 The electromagnetic shielding plate is formed of a
conductive plate having elasticity and is provided on the edge
thereof with a connecting strip bent in such a manner that the
tip thereof projects from the surface of the plate, and with
a supporting portion. When the electromagnetic shielding plate
and the printed substrate are connected, it is ensured that the
10 ground pattern 201 of the printed board 200 and the connecting
strip are brought into contact with respect to each other,
thereby a high shielding effect can be obtained.
